Repo and FX Swap: A Take of Two Markets

Introduction

- Repo and FX swaps are two most important short-term funding markets for U.S. dollar liquidity.
- The two markets share many similarities, but are also distinct along important dimensions.
- Dealers/banks play a central role in both markets. The time-varying intermediary balance sheet constraint is key to the pricing of dollar liquidity.
- Demystify the FX swap market using the MMSR transaction data: Despite the breakdown of CIP, the FX swap market is an overall well-functioning market, and helps fulfill significant dollar liquidity demand during stress days.

Outline of the Talk

1. Overview of the two markets: similarities and differences

- Market structure
- Balance sheet implication and regulatory treatments
- 2. Linkages between the two markets
 - Funding cost comparison
 - Quarter-end dynamics
- 3. Implications for financial stability
 - Central bank swap line and standing repo facility
 - Issues during QT

Intermediary Balance Sheet Implications

Figure 2: On-Balance-Sheet Activities

э

- 4 回 ト - 4 三 ト

Balance Sheet Usage and Regulatory Treatments

- Both types of activities face little risk-based capital charge.
- Gross USD repo borrowing and lending stay on balance sheets
 - Exception is "sponsored" repo where the borrowing and lending can be netted, still a small segment of the repo market.
- Gross FX swap USD borrowing and lending can be netted off (except for margins). Only net FX swap borrowing/lending stay on balance sheets.
 - CIP arbitrage positions, e.g. borrow \$ in the cash market and lend in the FX swap market, stay on balance sheets.
- FX swaps activities can potentially worsen G-SIB capital surcharge more than repos.

Large dealers can borrow at the triparty rate, and lend at a spread over the triparty rate up to 15 bps on average.

Dollar Funding Cost in the FX Swap Market

It is generally more expensive to fund USD in the EUR-USD swap market than in the U.S. repo market

 Du, Strasser and Verdelhan (2023) use EUR-USD FX swaps from the MMSR data (2018-2021)

Summary of Quarter-End Dynamics

- Quarter-end balance sheet constraints significantly contract matched-book repo intermediation.
- Euro-area MMSR banks significantly increase their dollar borrowing in the FX swap market, and maintain their dollar lending in the FX swap market.
- The FX swap market acts an important residual market for MMSR banks to obtain dollar funding on quarter-ends: Overall higher FX swap volume incurs the quarter-turn premium!

Implications for Crisis Response

- Global dollar funding markets are highly segmented. The FX swap market often represents the most challenging segment of the funding market for offshore participants.
- Hierarchy of money market rates: FX swap implied rate > \$CP/\$CD (\$Libor) > \$OIS > \$Repo/Fed Funds.
- Bringing the highest rate (FX swap) down helps restore functions in all other short-term funding markets.
- Central bank liquidity swap is one of the most effective tools for crisis response.

Conclusion

- The dollar funding market is highly global. Repo and FX swap markets are intimately connected. Both markets are crucial to global financial stability.
- Despite large and persistent CIP deviations, the FX swap market is functional and serves core functions of providing dollar funding to market who lack ready access to cash market funding, albeit at higher costs.
- The resilience of the two markets depends on the intermediary balance sheet capacity, ample reserves, and central bank liquidity backstops.
