

On the Measurement of Wealth: New Issues and Evidence from WID.world

Thomas Piketty

EHESS and Paris School of Economics

Banque de France, December 14 2017

- World Wealth and Income Database (WID.world): continuation of Kuznets 1953, Atkinson-Harrison 1978 and the World Top Incomes Database 2011. Main novelties:
 - Extension to emerging countries
 - Coverage of full distribution, from bottom to top
 - **first global inequality study in World Inequality Report 2018**
 - Extension to wealth inequality (and not only income inequality)
 - **unfortunately data sources are more limited on wealth than on income. HFCS = major progress, but not enough.**
- Self-reported wealth data needs to be supplemented with proper administrative/fiscal data. Major measurement and policy issue.**

- The WID.world project: more than 100 researchers over the five continents. All the data is entirely open source + transparent to feed public debates.
- This report: first systematic assessment of globalization in terms of inequality. Global top 1% captured twice as much growth as bottom 50% since 1980. Under Business as usual, even with optimistic growth assumptions in the emerging world, global inequality will continue to rise.
- Rising inequality is not inevitable: different types of policies can be implemented to promote equitable growth pathways in the coming decades.
